

Professional Statement

Google Cybersecurity Professional Certificate — Course 1 portfolio activity

Professional statement

I am a Computer Science undergraduate with three years of professional IT experience at a large Brazilian technology company that delivers solutions to public-sector organizations. Working remotely, I served as a requirements analyst, data engineer, data scientist, and data analyst, contributing to public-sector service orders from requirements gathering through delivery. Along the way, I built data pipelines and dashboards with Python and SQL and delivered three OCR projects that combined machine learning with pattern matching. I am a clear communicator, naturally curious, and committed to continuous learning.

My interest in cybersecurity began with a simple question: how exposed am I? The more I studied, the more the field drew me in. I enjoy the strategic side of security, thinking like an attacker in order to build stronger defenses, and I am especially drawn to penetration testing. I am building a solid foundation through the Google Cybersecurity Professional Certificate and hands-on wargames such as OverTheWire, and I document my progress publicly on GitHub.

I want to bring my technical background, communication skills, and experience with public-sector projects to a security team, where I can help organizations identify and reduce risk before attackers can exploit it, and protect the people who depend on them.

Outline

Step 1 — Strengths

- **Communication:** I explain technical topics clearly to both technical and non-technical audiences, a skill I developed by gathering requirements from stakeholders and presenting results to them.
- **Curiosity and continuous learning:** I actively seek out new knowledge and keep up with changes in technology. I study primarily in English, including hands-on labs, courses, and technical documentation.
- **Technical background:** Python, SQL, data engineering, machine learning, deep learning, and AI engineering, including three OCR projects delivered from design to production.
- **Professional experience:** Three years in IT at a large company serving public-sector clients, as a requirements analyst, data engineer, data scientist, and data analyst.

Step 2 — Values

- **Continuous learning with ethical practice:** Cybersecurity is a field where learning never stops, and that is what motivates me. It feels like a strategy game I enjoy playing from

either side, attacker or defender, always within legal, ethical, and professional boundaries.

- **Protecting people and organizations:** My interest began with wanting to understand and reduce my own exposure to threats. Today, I want to help people and organizations be, and feel, more secure.

Step 3 — Clarifying questions

1. What most interests me about the field of cybersecurity?

Penetration testing, and reaching a level of knowledge that lets me keep pace with the constant changes in threats, tools, and techniques.

2. Who is the audience for my professional statement?

Cybersecurity recruiters and hiring managers, including organizations that serve the public sector.

3. In what ways can my strengths, values, and interest in cybersecurity support the security goals of various organizations?

My experience at a large IT company contracted by public-sector organizations gave me direct exposure to how public-sector solutions are specified, built, and delivered, including participation in multiple service orders. Combined with my background in data and systems, my communication skills, and my drive to keep learning, this helps me understand business requirements, identify risks, and communicate security findings clearly to the people who need to act on them.
